

Library School Programs and the Successful Training of Academic Librarians to Meet
Promotion & Tenure Requirements in the Academy.

Abstract:

This article relates an investigation of tenure and promotion practices for librarians at academic institutions. The study employed two surveys. The first survey determined the level of impact on promotion and tenure by recent publication in two top-tier peer-reviewed journals: *College & Research Libraries* and *Journal of Academic Librarianship*. The second survey was developed and distributed to authors of articles in the two journals requesting information about the nature of their library positions. Although more research is warranted, it appears that librarians at academic institutions tend to publish more frequently in top tier journals, enhancing our professional literature.

Introduction:

During the winter of 2008, the Dean of the Auburn University at Montgomery Library was asked to investigate the tenure and promotion practices for librarians at other academic institutions. In developing the survey, we sought to discover any influence that publication in specific journals had for promotion and tenure, beyond the nature of a journal's being peer-reviewed. We also sought to analyze the educational background of successful authors to determine whether or not there was a correlation between masters programs in library / information science and the likelihood of success for graduates of those programs. A brief survey was developed and sent to directors and deans of libraries represented by authors who published in either *College & Research Libraries* or *Journal of Academic Librarianship* between

2000 and 2006. These two journals were selected because it was felt that these had the most direct correlation to academic libraries, and that the importance of these titles would have some impact on tenure and promotion practices. Also, *College & Research Libraries* and *The Journal of Academic Librarianship* are cited as “the major journals in academic librarianship.”¹

A second survey was developed and distributed to the authors of articles in the two journals requesting information including from what school they received their MLS degree. This survey was distributed in order to examine librarian productivity in research and publication, and to attempt to ascertain the influence of the academic programs and training they received in their degree programs.

Literature Review

Tenure Status

Our review of literature focused on two areas: Tenure and faculty status for librarians and publication patterns for librarians. Betsy Park and Robert Riggs reported on evaluative criteria used in promotion and tenure decisions for academic librarians.² Park and Riggs determined by survey that job performance was the primary factor in achieving tenure and promotion, followed by service and scholarship.³ Park and Riggs also noted the distinction in expectations for research and publications amongst institutions. Liberal Arts schools, with smaller libraries and smaller library staff, rarely require librarians to publish. Larger research universities utilize research and publication as main components in the review process for tenure and promotion.⁴

Ronald Rayman and Frank Wm. Goudy submitted a questionnaire to ARL directors. The data from this survey indicated that while “Faculty status and tenure eligibility were key elements in establishing publication as a requirement for librarians” only ten of the responding institutions

required publication for promotion and tenure. One of the ten reported that it was required for promotion only.⁵ The Rayman and Goudy data showed that librarians were “encouraged” to publish, but not required to do so at forty-one institutions. At seventeen institutions, librarians were not required to publish.⁶ Joyce Payne and Janet Wagner expanded upon the Rayman and Goudy study to include University libraries and four-year college libraries. Payne and Wagner surveyed fifty-nine academic libraries to determine not only the status of librarians, but also information on terms of employment and educational requirements.⁷ Among their determinations was that 60% of the librarians in the survey held faculty status. To support librarians’ efforts to conduct research and to publish, libraries and universities offered a variety of support services, including special leaves and sabbaticals; travel funds; and research funds for which the librarians compete with the teaching faculty. For the greatest number of librarians responding to the survey, publishing was an option for tenure and promotion.⁸ While encouraged, publishing was not cited by the librarians as an absolute requirement.

W. Bede Mitchell and L. Stanislava Swieszkowski provided research on publication requirements for librarians and the effect on tenure approval rates.⁹ Mitchell and Stanislawski surveyed one hundred and forty-seven U.S. academic libraries that were either full or associate members of the Center for Research Libraries.¹⁰ Mitchell and Swieszkowski reported that for a five year period (1979-1983), 36.2 percent of the responding institutions held faculty status equivalent to that of the teaching faculty; 52.2 percent had an academic status separate or different from the teaching faculty, and 11.6 percent indicated that their particular institution had a nonacademic professional status for the librarians.¹¹ Of the institutions surveyed (81), 58.7 percent (38) had tenure-track status for most or all of their librarians, and 41.3 (43) percent did not. Of the institutions with tenure-track status, 46.9 percent required evidence of research and

publication before a librarian could achieve tenure, while 53.1 percent did not require publication.¹²

Of the institutions requiring research and publication, Mitchell and Swieszkowski found that 97.4 percent gave credit for publishing books, chapters in books, and refereed articles in the field of library/information science. The majority of institutions gave credit for publications outside of the library field (89.5 percent). The responding institutions did not have a requirement on the number of publications.¹³ The tenure approval rates for librarians in Mitchell and Swieszkowski's study was 81.5 percent. As noted by Mitchell and Swieszkowski, tenure-track status for librarians does not always imply the requirements to publish.¹⁴

Park and Riggs conducted a national survey of tenure and promotion policies for academic librarians in 1989.¹⁵ Park and Riggs observed that tenure evaluation for faculty is "anchored in effectiveness of teaching, scholarship, and service. For librarian faculty, evaluation is based on librarianship, scholarship, and service."¹⁶ Park and Riggs noted the variance in the literature on the importance of publication in terms of tenure evaluation, stating that "Publication does not appear to play a pivotal role in the tenure in promotion process. It is one factor, but its importance is not clearly defined."¹⁷ In institutions where librarians held faculty status, Park and Riggs reported that 85 percent of the institutions evaluated the librarians on research and publications in addition to job performance. Where librarians held professional or other status, only sixty-five percent of the institutions evaluated research and publication in consideration of tenure and/or promotion.¹⁸ In analyzing their data, Park and Riggs noted that while publication was evaluated by the majority of institutions in which librarians held faculty status, seventy-percent of those institutions do not require publication, although publication may be encouraged.

Sixteen percent of the faculty status institutions do not review publication activity in tenure and promotion considerations.¹⁹

Publication Patterns

David F. Kohl and Charles H. Davis reported on ratings of journals by ARL Library Directors and Deans of Library and Information Science Schools in January of 1985. Kohl and Davis investigated whether consensus existed in the perception of journal prestige by ARL Directors and Deans of Library and Information Science Schools, and measured the perception of value for tenure and promotion.²⁰ Kohl and Davis determined journal rankings by establishing a single, weighted score for each journal by summing respondent rankings for a journal then dividing by the number of respondents. Respondents were asked not to rank a title they were not familiar with. A no response was calculated as a zero value.²¹ Kohl and Davis determined that while there was rough agreement on the ratings for two-thirds of the journals, the deans and directors differed substantially in their rankings for the final one-third. The top five ranked journals for ARL directors were *College & Research Libraries*, *Library Quarterly*, *Journal of Academic Librarianship*, *Library Resources and Technical Services*, and *Library Trends*. For the deans of library schools, their top five ranked journals were *Library Quarterly*, *Journal of the American Society for Information Science*, *College & Research Libraries*, and *Library Trends*. The *Journal of Academic Librarianship* was ranked eleventh by the deans.²² Thomas Nisonger joined with Charles Davis to repeat the study which was published in 2005, increasing the number of journals to be ranked from thirty-one in the original study to seventy-one²³ Replicating the original Kohl and Davis survey, respondents were asked to rate journals on a 1 to 5 ordinal scale “concerning how important publication in that journal was for promotion and tenure at their institution.”²⁴ Nisonger and Davis added a second component to the survey,

asking the ARL Library Directors and the Deans of Library and Information Schools to list “in no particular order the five most prestigious journals to have published in for promotion and tenure purposes at your institution.”²⁵ Nisonger and Davis determined that there remained considerable stability in both the directors and the deans’ perception of journals since the original study was conducted.²⁶ The top five journals ranked by ARL directors in Nisonger and Davis’s study include: *College & Research Libraries*; *Library Trends*; *Journal of Academic Librarianship*; *Library Quarterly*; and *Reference & User Services Quarterly*. For the deans, the top five titles were: *Journal of the American Society for Information Science & Technology*; *Library Quarterly*; *Library & Information Science Research*; *Annual Review of Information Science & Technology*; and *Information Processing & Management*. In the deans list, *College & Research Libraries* was ranked eighth, and the *Journal of Academic Librarianship* was ranked twenty-third.²⁷ The Nisonger-Davis study, like the earlier Kohl-Davis study, demonstrates that “a hierarchy of prestige among LIS journals does indeed exist, but the hierarchical order differs somewhat between the two constituencies. There is notable continuity in the perception of LIS journals over a twenty-year period, but more so in the directors’ perceptions than in the deans’.”²⁸

Mary Kim studied the rankings of library and information science journals by comparing perceptual measures (as used in the Kohl-Davis and Nisonger-Davis studies) with citation-based measures.²⁹ Kim developed three hypotheses to test conceptions about journal prestige rankings. These were: Hypotheses set 1: LIS journals with higher prestige rankings will typically (a) be older journals, (b) have higher circulation rates, (c) be covered by more indexing services, and (d) be more research oriented. Hypotheses set 2: LIS journal prestige rankings will be significantly correlated with journal rankings by (a) total discipline citations, (b) discipline impact factor, (c) discipline immediacy index, (d) references per paper, (e) Price’s Index, (f)

discipline citation factor, (g) discipline popularity factor, (h) discipline consumption factor, and (i) discipline self-citation rate. Hypothesis set 3 essentially restated Hypothesis set 2, with set 3 controlling for journal age, circulation, index coverage, and orientation.³⁰

Kim's work indicated the following patterns existed: 1. Discipline citation measures identified a core of top journals which overlapped with the core listings of directors and deans for a similar time period; 2. library school deans and ARL directors valued publication in journals which "fed information to the network" and had an impact on current writing; deans specifically valued publication in journals with a research orientation, reflected by a higher number of references per paper and in older practitioner journals with higher consumption values; and 3. deans and directors appeared to use different criteria in judging the value of a publication for tenure and promotion.³¹

Pamela Bradigan and Carol Mularski surveyed 104 directors of libraries in the Carnegie Classifications of Research Universities I and II, and 104 directors in Doctorate-Granting Universities I and II to assess the values of academic librarians' publications for tenure and initial promotion.³² The survey created by Bradigan and Mularski examined library directors' ranked publication evaluation criteria for relative importance in the tenure and promotion process. The directors' responded to criteria for ranking monographs and journal articles. For monographs, the following criteria were used: (a) solicited assessments of publications by experts outside the institution; (b) solicited assessments of publications by experts within the institution; (c) unsolicited assessments of publications (internal and external to institution); (d) reviews of the book/monograph published in journals or other reviewing sources; (e) Awards or other formal recognition of publications; (f) Citations of publications; (g) OCLC search to check the number of institutions that own the item; and (h) Quantity of publications. The criteria for

journal articles included (a) the nature of the articles (i.e., research paper vs. practice-based paper); (b) solicited assessments of articles by experts outside of the institution; (c) solicited assessments of articles by experts within the institution; (d) unsolicited assessments of articles (internal and external to institution); (e) letters to the editor commenting upon the article; (f) Awards/other formal recognition of articles; (g) citations of articles; (h) articles appearing in refereed journals; (i) indexing/abstracting services where the journal is listed; (j) perceived value of the journal to the profession; (k) journal impact ranking from the Institute for Scientific Information's Citation Indexes; (l) requests for reprints; (m) quantity of journal articles.³³

Within their survey responses, Bradigan and Mularski determined that 63.5 percent of libraries who responded that their librarians held faculty status required publication, as opposed to encouraged publication.³⁴ Of the two types of institutions surveyed, research institutions were found to place a higher value on awards and other formal recognition of monographs, and on assessment by experts outside of the institution. For journal articles, research institutions placed a higher value on solicited assessments both from internal and external sources. Research institutions also rated article citations and awards for journal articles more highly than did doctoral-granting institutions.³⁵ The respondents to the survey identified as the four most important criteria for monographs as being solicited assessments (both internal and external), awards, and reviews. Several directors however, noted that the lack of a book publication would not prevent a candidate from attaining tenure and initial promotion. For journal articles, the four most important criteria were cited as being the article appearing in a refereed journal, the nature of the article, the perceived value of the journal to the profession, and solicited assessments of the articles by experts outside of the institution. In comparing the survey results, Bradigan and Mularski noted the perfect agreement between library directors of research and doctoral granting

institutions on having articles appear in refereed journals.³⁶ Bradigan and Mularski went on to recommend that librarians should “concentrate on writing research papers (e.g., reports of survey results, annotated bibliographies) rather than practice-based articles.”³⁷

Mickey Zemon and Alice Harrison Bahr conducted an analysis of articles written in *College & Research Libraries* and *Journal of Academic Librarianship* and determined that college librarians author fewer articles than those in universities.³⁸ Zemon and Bahr noted while previous studies “affirmed the tenure requirement as the key impetus to publishing,” it was not true for college librarians. In fact, noted Zemon and Bahr, more than 50 percent of the authors considered tenure the least important motivating factor. More than 70 percent of the college librarians published to share innovations or concerns, and to achieve recognition.³⁹ Zemon and Bahr also noted the regional characteristics of publication, with librarians from the Midwest and the Northeast publishing the most articles, while the West, Southeast, and Southwest published less.⁴⁰

In an analysis of publication patterns of U.S. academic librarians from 1998 to 2002, Stephen E. Wiberley Jr., Julie M. Hurd, and Ann C. Weller noted a decline in the number of refereed articles published by academic librarians by 4.01 percent.⁴¹ Within *College & Research Libraries* and *Journal of Academic Librarianship*, Wiberly, Hurd and Weller determined that academic librarians constituted 77 percent and 70 percent, respectively, of the authors published by the journals during the time period of 1998 to 2002.⁴² Wiberly, Hurd and Weller also replicated the report from their 1993 to 1997 article on publication patterns by academic librarians to report on changes in rankings of the most “productive” libraries by measuring the number of authors from institutions and the number of articles published.⁴³

Summary

The literature review demonstrates the importance of research and publication for librarians, either within the tenure process or within the promotion process. For those institutions in which librarians hold a professional status, publication is a significant determinant for gaining promotion. This remains true even where institutions do not “require” publication for promotion. In analyzing the publication patterns cited by Kim, Kohl-Davis and Nisonger-Davis, the significant factor relative to journal prestige is whether or not the journal is peer-reviewed.

The Directors Survey

We began our survey with the Directors / Deans of libraries identified in articles published in *College & Research Libraries* or *Journal of Academic Librarianship* for the period 2000 to 2006. We limited our survey to four-year colleges and universities, as these were the most like our institution. The survey was distributed by e-mail April 1st, 2008, and respondents were asked to complete the survey by April 18th. A total of two hundred and forty-nine surveys were distributed in regional groupings, using the 1978 designations made by the ALA Committee on Accreditation of graduate library school programs as cited by Osgaard.⁴⁴

The survey asked very basic questions: Do Librarians at your institution hold faculty rank and tenure? Do you have written requirements for tenure and promotion? Do these requirements include publication in peer-reviewed journals? Is there a specific requirement in the number of peer-reviewed articles published for tenure? Do you have specific requirements in the number of peer-reviewed articles published for promotion? (These would be the number of articles published in addition to those published for tenure) And, are specific journals given greater weight for tenure and/or promotion? The respondents were asked to list the titles.

We were particularly interested in the last question as we wished to know if specific titles were being emphasized, and whether we should direct our mentoring focus to aid our non-tenured librarians to succeed in publishing in specific journals. Monographic publications were not emphasized in our survey because we are a smaller, regional institution, with limited support funds to assist librarians in the research efforts needed for monographic publications.

Directors Survey Results

The return rate for the directors’ survey was 41.3 percent. Table 1 indicates the return rates by region.

Table 1
Library Directors’ Survey Response Rates
By Region

Region	# Surveys Sent	# Surveys Returned	Return Rate
Midwest	50	22	44.0%
Northeast	66	31	46.9%
Southeast	43	15	32.5%
Southwest	19	4	21.0%
West	37	17	45.9%
Total	215	89	41.3%

Our beginning analysis was to determine how many of the libraries operated with faculty rank and faculty status for their librarians. In examining the data, we realized that our initial survey was not detailed enough in that we did not include a category for “professional” status.

Fortunately, the respondents were clear in providing this information. We also discovered in looking at the data that some institutions reported having faculty status for the librarians, but did not have tenure – rather they maintained a continuing appointment similar to those institutions reporting a “professional” category for the librarians. In conducting our analysis, we examined

the responses for faculty status by region. We also analyzed responses from ARL libraries to determine whether or not differences in faculty status could be observed. Table 2 contains the results of this analysis.

Table 2
Directors Survey on Faculty Status

Region	Non-ARL			ARL			Total		
	Faculty Status	Professional	Other	Faculty Status	Professional	Other	Faculty Status	Professional	Other
Midwest	8	4	0	5	4	1	13	8	1
Northeast	16	5	0	3	7	0	19	12	0
Southeast	6	2	1	3	3	0	9	5	1
Southwest	0	3	0	1	0	0	1	3	0
West	13	1	0	2	0	1	15	1	1
Total	43	15	1	14	14	2	57	30	3

The other responses in this data set included an institution which offered both a faculty status/tenure track and a professional track. The faculty status track was identified as requiring more publications to achieve tenure. Two institutions reported that librarians held faculty status, but not tenure, indicating a lack of precision in the survey instrument.

With the non-ARL libraries responding to the survey, the overwhelming preference is for faculty rank and status. Only in the southwestern region was a professional status for librarians favored, and the sample results here are too small to be conclusive. All together, 72.8 percent of the non-ARL libraries provided for faculty rank and status. Of the ARL libraries who responded, the results were almost evenly split: 46.6 percent provided faculty rank and status, 46.6 percent included librarians in a professional category, and 6.6 percent either offered a dual status track where some librarians were on a faculty status with tenure and others were on a professional track, or where the librarians held rank and status, but not tenure. The results of the survey are comparable to the data provided by Park and Riggs.⁴⁵ Park and Riggs determined that 41.1

percent of 304 institutions surveyed provided librarians with faculty rank and status.⁴⁶ As a part of faculty rank and status, publication has been documented as a significant factor in assessment for tenure and promotion.

As noted by David Groves, tenure and promotion is a “feedback/communication process (Formative Evaluation). Whether it is tenure or promotion, a plan must be developed in teaching, research, and service.”⁴⁷ A primary element of this communication process is the existence of written policies which communicate tenure and promotion policies and expectations. Within the AUM survey, library directors were asked to respond to the existence of written policies and procedures regarding tenure and promotion. Table 3 below provides the survey results.

Table 3
Written Policies for Tenure & Promotion

* Indicates respondents reported the question as Not Applicable. In the Midwest region, one institution had no policies and two directors marked N/A. Similar data is reported for the other regions.

Region	Policies for T & P		Policies for Promotion Only		No Written Policies	
	ARL	Non-ARL	ARL	Non-ARL	ARL	Non-ARL
Midwest	5	9	4	1	0	3*
Northeast	3	16	6	1	1*	4*
Southeast	3	6	0	3	3*	0
Southeast	1	0	0	2	0	1*
West	2	13	1	0	0	1
Regional Total	14	44	11	7	4	9
Aggregate Totals		58		18		13

Of the ARL Libraries, 48.2 percent reported having written policies regarding tenure and promotion; 37.9 percent have written policies for promotion only. Surprisingly, 13.7 percent of the responding ARLs report having no written policies. For the non-ARLs, 73.3 percent have

written policies regarding tenure and promotion; 11.7 percent have written policies for tenure only, while 15.0 percent report either the question was either not applicable because the institution does not provide for faculty status for the librarians, or that they do not have written policies.

Mitchell and Swieszkowski,⁴⁸ along with Floyd and Phillips⁴⁹, have reported on tenure as being “a key impetus” to publish, with nearly 80 percent of the authors surveyed by Floyd and Phillips reporting a requirement to publish. A major consideration, however, is the type of publication involved. Bradigan and Mularski have identified that 63.5 percent of the librarians holding faculty rank and status are required to publish articles in peer-reviewed publications.⁵⁰ Table 4 below indicates the response rate by region for peer-reviewed publications.

Table 4
Peer-Reviewed Publication Requirements
For Librarians by Region

Region	Peer Review Required		Peer Review Encouraged		Not Required	
	ARL	Non-ARL	ARL	Non-ARL	ARL	Non-ARL
Midwest	4	5	5	6	0	2 N/A
Northeast	5	13	3	5	2 N/A	3 N/A
Southeast	2	7	1	2	3 N/A	0
Southeast	0	1	1	1	0	1 N/A
West	1	9	2	4	0	1 N/A
Regional Totals	12	35	12	18	5	7
Aggregate Totals		47		30		12

The respondents to this question reported on whether peer reviewed journal publications were required, encouraged, or not required. A number of institutions reported as Not Applicable the question because the institution did not provide faculty rank and status for the librarians. Of the ARL Libraries, 82.6 percent either required or encouraged to publish. This is up significantly from the 76.0 percent identified in the Rayman and Goudy study.⁵¹ Only 17.2 percent listed no

requirement for publication in regards to tenure and promotion. For the non-ARL libraries, 58.3 percent require publication, 30.0 percent encourage publication, and 11.7 percent do not require publication. Overall, 52.8 percent of the responding libraries require publication, 33.7 percent encourage publication, and 13.5 percent have no requirement. These figures overall are slightly lower than those cited by Bradigan and Mularski.⁵²

Mitchell and Swieszkowski reported that 46.9 percent of the institutions with tenure-track status for their librarians required publication.⁵³ Payne and Wagner observed that for the majority of librarians in their study, publishing was an option, rather than a requirement.⁵⁴ In examining the data in table 5, we see that of the 89 respondents in the survey, 48.3 percent of the institutions required peer-reviewed articles. Another 23.6 percent of the institutions had peer-reviewed articles as one option in their tenure reviews, but the peer-reviewed injunction was not mandated. Finally, 28.1 percent of the institutions did not require publication. Faculty status positions placed the greatest requirement on peer-reviewed publications. Institutions with faculty status for librarians equate to 90.6 percent (n=29) of the requirement distribution, whereas institutions in which librarians hold a “professional” or other status comprised 9.3 (n=2) percent of the requirement.

Our survey results indicated that librarians with faculty status have an option for peer-reviewed publications in 71.9 percent of the responding institutions, whereas 13.5 percent of the librarians with professional status have an option for consideration of peer-reviewed articles for promotion review consideration. Librarians with faculty status have no requirement for publication at 35.7 percent of the institutions, while professional status librarians have no requirement for publication at 64.3 percent of the institutions. While librarians with professional

status do not have the same level of pressure for publication in peer-reviewed journals, the importance of publishing for successful career advancement can be seen in these results.

Table 5
Faculty Status and Requirements
For Peer Reviewed Articles

	Midwest		Northeast		Southeast		Southwest		West	
	Faculty Status	Prof. Status	Faculty Status	Prof. Status	Faculty Status	Prof. Status	Faculty Status	Prof. Status	Faculty Status	Prof. Status
	13.5*	8.5*	19	12	10	5	1	3	16	1
Peer Reviewed Articles Req.	9	0	14	2	8	1	0	1	8	0
Peer Reviewed Articles Option	5	1	5	2	3	0	0	1	4	0
Peer Reviewed Articles Not Required	3	4	0	8	0	3	1	1	3	2

* One institution provides an option for librarians in selecting either tenure-track or professional status.

Librarians at ARL libraries who hold faculty status have requirements for peer-reviewed publications at 84.6 percent of the institutions, versus 15.4 percent of the librarians in a professional classification. There is an even division between librarians with faculty status and professional status, with 50 percent of the institutions considering (but not requiring) peer-reviewed articles in submission for tenure and promotion decisions. Only 18.2 percent of faculty status librarians in ARL institutions have no requirement to publish in peer-reviewed forums, while 81.8 percent of the professional status librarians in those libraries have no publication requirements at all. These figures are significantly above those cited by Mitchell and Swieszkowski,⁵⁵ Floyd and Phillips,⁵⁶ or Bradigan and Mularski.⁵⁷

Our final questions on the survey related to specific requirements for a number of peer-reviewed articles for tenure, and for promotion. And finally, we asked specifically if certain

journals were given greater weight in tenure and/or promotion decisions. On question 4, dealing with the number of publications required for tenure, 43 institutions answered either “0” or “N/A.” Twenty-eight institutions, 8 of which were ARLs, responded “Not specified. Four institutions (non-ARLs) required 1 to 2 publications for tenure; nine non-ARLs required 3 to 5 articles for tenure; and two ARLs required 3 to 5 articles for tenure. For question 5, asking for the number of peer-reviewed articles required for promotion, 37 institutions including 14 ARLs responded that there was no requirement, or that the requirement was not applicable. No specifications were recorded by 35 institutions, including 9 ARLs. Five institutions, including 3 ARLs require an additional 1 to 2 articles beyond tenure for promotion; 5 (including 1 ARL) require 3 to 5 articles for promotion; and 4 institutions, all non-ARLs, require 6 or more articles for promotion.

For the question on specific journals, 13 respondents listed that “peer-reviewed are given more weight,” 8 directors listed a preference for “publications in librarianship,” and one ARL director reported greater weight being given for “high impact journals.” Five institutions, including one ARL, listed the following journals as being given greater weight in tenure and promotion decisions: *College & Research Libraries* (mentioned by 4 institutions), *Journal of Academic Librarianship* (mentioned by 3 institutions); *Library Quarterly* and *Reference & User Services Quarterly*, each mentioned once.

The data confirms that publication in peer-reviewed journals is a predominant job element for academic librarians, regardless of whether or not they are employed by an ARL library. Publication for tenure remains a significant element, but the data suggests that we are now seeing an increase in publication expectations for promotion as well. While faculty status remains the

significant element in driving publication, those institutions with professional status utilize publication requirements in areas such as promotion.

Librarians Survey Results

Simultaneously to our survey of library directors, we conducted a survey of the authors of articles which were published in *College & Research Libraries* or *Journal of Academic Librarianship*. In conducting our survey, we limited our coverage to academic librarians at four year institutions who had published in these journals during the period from 2000 to 2006. A total of 428 surveys were distributed and 145 were returned, for a return rate of 33.87 percent. Table six shows the geographic breakdown for the respondents, based upon their current place of employment.

Table 6
Librarian Survey Response Rates

Region	# of surveys sent	# of surveys returned	Return Rate
Midwest	103	36	34.95%
Northeast	126	36	28.57%
Southeast	87	28	32.18%
Southwest	50	16	32.00%
West	62	26	41.94%
NA	0	3	0%
Total	428	145	33.87%

In the survey, we asked for the following information: name, institution/library in which they were employed, length of time employed as a librarian, the name of the school from which they received their Master’s degree in librarianship, whether or not their institution provided faculty rank and tenure for librarians, whether or not the respondent held tenure, and how many articles they had published in peer-reviewed library journals between 2000 and 2006. In asking for the number of articles, we listed options as 0, 1, 2, 3, and 4 or more.

We asked for information such as name and institution to aid us in clarifying individuals who had similar names. The institution information was used to break down the survey results by ARL and non-ARL libraries, and thereafter by the geographic regions reported by Olsgaard. Our main function, however, was to measure the publication counts tied back to the school from which the individual received their MLIS degree. In table seven, we list the number of respondents, broken out by ARL and non-ARL categories, and the number of articles they cited.

Table 7

Librarian Survey Results

Number of Articles Published from 2000-2006

Region	0		1		2		3		4 or more		Total
	ARL	Non-ARL	ARL	Non-ARL	ARL	Non-ARL	ARL	Non-ARL	ARL	Non-ARL	
Midwest	1	1	3	3	3	1	8	1	11	4	36
Northeast	0	0	3	6	3	2	3	4	12	3	36
Southeast	0	0	1	1	2	1	2	7	5	9	28
Southwest	0	0	0	1	2	1	0	2	9	1	16
West	0	0	1	4	1	3	0	3	8	6	26
Total	1	1	8	15	11	8	13	17	45	23	142

In examining the data, we discovered that ARL librarians published at a greater rate than librarians in non-ARL libraries. The average number of articles published by the ARL respondents was 3.20, compared to the non-ARL average of 2.69. This data is consistent with the trends reported by Mitchell and Swieszkowski,⁵⁸ Floyd and Phillips,⁵⁹ and Bradigan and Mularski.⁶⁰

Table 8

Librarian Survey Results

Number of Publications by ARL and Non-ARL Librarians

	ARL	Non-ARL	Total
Midwest	77	24	101
Northeast	66	34	100
Southeast	31	60	91
Southwest	40	33	73
West	35	43	78
Total	249	194	443

Data from our survey indicates that the number of publications by ARL librarians is higher than that of librarians at non-ARL libraries. ARL Librarians reported 249 publications compared to 194 by non-ARL librarians. In looking at the regions in which the respondents are currently employed, the Midwest is the most productive region overall with 101 publications, followed by the Northeast (n=100), Southeast (n=91), West (n=78), and Southwest (n=73). Because locations were not discernable for three individuals in the survey responses, these were not counted in the publication totals by region. Among ARL librarians, the Midwest was most productive with 77 articles published, followed by the Northeast (n=66), the Southwest (n=40), the West (n=35), and the Southeast (n=31). Non-ARL librarians were most productive in the Southeast, with 60 publications, followed by the West (n=43), the Northeast (n=34), the Southwest (n=33), and the Midwest (n=24).

We next examined the schools from which the respondents indicated receiving their MLIS. A total of 145 respondents indicated their schools. The top five schools listed were: the University of Illinois Urbana Champaign, the University of Wisconsin Madison, the University of Michigan, and tied for fifth were the University of Kentucky, the University of North Carolina Chapel Hill, the University of Pittsburgh, Kent State University, Syracuse University, and the University of Texas at Austin. The number of graduates for these schools is listed in table nine.

Table 9**Library School Programs****Attended by Survey Respondents**

School	# of Graduates
University of Illinois Urbana-Champaign	13
University of Wisconsin Madison	7
University of Michigan	7
Indiana University	6
University of Kentucky	5
University of North Carolina Chapel Hill	5
University of Pittsburgh	5
Kent State University	5
Syracuse University	5
University of Texas Austin	5
Louisiana State University	4
University of Oklahoma	4
SUNY Albany	4

University of Washington	2
Emporia State University	2
San Jose State University	2
University of California Los Angeles	2
University of Maryland	2
Simmons College	2
University of Hawaii	2
University of Tennessee	2
University of North Texas	2
Florida State University	1
University of Western Ontario	1

Dalhousie University	1
McGill University	1
Vanderbilt University	1
Total	145

We then matched the schools from which the librarians graduated to the number of publications they reported and developed an average. In doing this, we observed that our survey question dealing with publications allowed respondents to select 4 or more publications. Because no specified number above 4 was required, we determined that the appropriate response was to establish a base value of 4, regardless of how many additional articles the respondent had published. To obtain an average number of articles per graduates at each institution, we divided the total number of articles published by authors from a specific program by the number of graduates for the school. This gave us a productivity average, which is reported in table ten.

Table 10

Average Number of Publications by MLIS School Attended

	Avg. pubs per school (max=4)
Columbia University	4.00
Emory University	4.00
Florida State University	4.00
Southern Connecticut State University	4.00
University of Arizona	4.00
University of Chicago	4.00
Wayne State University	4.00
University of Kentucky	3.80
University of North Carolina Chapel Hill	3.80
University of Alabama	3.66
University of Pittsburgh	3.60
University of South Carolina	3.50

University of Tennessee	2.00
Vanderbilt University	2.00
University of Texas Austin	1.80
University of Iowa	1.66
University of North Texas	1.50

As table ten shows, three of the top six schools in terms of productivity for their graduates no longer offer ALA accredited degrees. Columbia ceased its library school program in 1993. The programs at Emory University and the University of Chicago ceased in 1990. The top ten schools, in terms of productivity for publication are Florida State University, Southern Connecticut State University, the University of Arizona, Wayne State University, University of Kentucky, University of North Carolina Chapel Hill, University of Alabama, University of Pittsburgh, the University of South Carolina, and Dominican University. Although *College & Research Libraries* and *The Journal of Academic Librarianship* provided the baseline for identifying the authors, not all of their publications are within these journals.

Regionally, a total of 41 Library and Information Science programs from Universities in the United States are listed in table 11. Breaking those schools down by region (see table eleven),

we see that 11 schools each are in the Midwest and Northeast regions of the country, followed by 9 in the Southeast, and 5 each in the Southwest and West.

Table 11

ALA Accredited Programs by Region

Region	Number
Midwest	11
Northeast	11
Southeast	9
Southwest	5
West	5
Other (Foreign)	3
Total	44

In examining the curriculum of the top ten library schools, all contained a course on research methods. Additionally, special topics courses, field placements, and directed studies were listed indicating opportunities for training in the conducting of research. These courses and programs of study are consistent with both the 1992 and the 2008 versions of the American Library Association’s Standards for Accreditation of Master’s Programs in Library & Information Studies.⁶¹ Both versions of the standards contain criteria I.2.5 under Mission, Goals, and Objectives. This standard stresses “the importance of research to the advancement of the field’s knowledge base.” Also included is standard II.3.2 under Curriculum, which states that the curriculum “emphasizes an evolving body of knowledge that reflects the findings of basic and applied research from relevant fields.”⁶² Though further study on this point is required, it appears that the emphasis being placed on research training by the library schools is being reflected in the number of articles being produced by working librarians. To determine whether or not this is a valid interpretation, an examination of articles published in *College & Research*

Libraries and *The Journal of Academic Librarianship* from 1993 to 2002 was conducted. In examining the publications, columns, bibliographies, editorials, and letters to the editors were excluded. Only unique articles with references were examined. A total article count was developed, and three types of authors were included: Library and Information Science Faculty; working Librarians in academic institutions; and “others.” Only where an author was employed in a US institution was it added into the total count. The others category included public and community college librarians, vendor representatives, and other university faculty. This data is included in table 12.

Table 12
Author & Article Comparisons
In CRL and JAL

5 Year Period / Journal	# Articles	# LIS Faculty	% Articles Authored	# Librarians	% Articles Authored*	# Other	% Articles Authored
1993-1997							
<i>CRL</i>	183	34	19%	220	65%	29	16%
<i>JAL</i>	157	18	11%	183	75%	22	14%
Total	340	52	15%	403	70%	51	15%
1998-2002							
<i>CRL</i>	179	30	17%	237	64%	34	19%
<i>JAL</i>	169	19	11%	166	59%	50	30%
Total	348	49	14%	403	62%	84	24%
Grand Total	688	101	15%	806	65%	135	20%

* In making the analysis, each article was calculated individually. Multiple authors were calculated separately, e.g., if a library school faculty member partnered with a member from another department on campus and a working librarian in an academic library, each received credit for authorship. We did not exclude authors who published multiple articles in these journals. In examining the articles within these two journals, multiple authors contributing to a work were only counted once.

In their 2006 article, Wiberly, Hurd and Weller examined thirty-two library journals and determined that there was a decrease of 3.75 percent in the number of refereed articles in library literature from 1993-1997 to 1998-2002.⁶³ While Wiberly, Hurd and Weller's study examined publication in thirty-two library journals, our study is limited to two – *College & Research Libraries* and *The Journal of Academic Librarianship*. In comparing the publication rates of these two journals for the same time period, we discovered a 3 percent decrease in the number of articles for *College & Research Libraries* and an 8 percent increase in the number of articles published in *The Journal of Academic Librarianship* for the period of 1998-2002. Overall, there was a 2 percent increase in the number of articles published in these two journals.

Conclusion

Considering the literature on tenure and faculty status for librarians, we believe that the necessity for publication is a strong influence for librarians in faculty and professional status – either for the achievement of tenure or for gaining promotion. This proposition agrees with the findings of Mitchell and Swieszkowski,⁶⁴ Floyd and Phillips,⁶⁵ as well as Park and Riggs,⁶⁶ all of which identify the requirement for publication as a factor in tenure and promotion decisions.

Zemon and Bahr, however, have documented that for college librarians, writing for tenure was “the least important motivating factor,” stating that “sharing innovations and concerns” and “recognition” were the most important factors encouraging these individuals to write.⁶⁷ Whether it is a result of writing for tenure and promotion or in writing to share innovations and gain recognition, the influence of the research courses in library schools seems to be paying off. Of the top ten library schools, graduates reported published an average of 1.256 articles. The top school was Florida State, averaging 4 articles published, followed by Southern Connecticut State University, the University of Arizona, and Wayne State University, each averaging 2 articles published by graduates.

Additional research is needed before we can conclusively state that the library school programs are training individuals sufficiently skilled in research to be able to make it successfully through a tenure and promotion process. For additional research, it would be useful to survey academic librarians in order to determine where they received training in research and publication. However, it appears that the inclusion of research courses is benefiting the profession by enhancing its professional literature.

APPENDIX A

Library Deans / Directors Survey

1. Do Librarians at your institution hold faculty rank and tenure?

Yes No

2. Do you have written requirements for tenure and promotion?

Yes No

3. Do these requirements include publication in peer-reviewed journals?

Yes No

4. Is there a specific requirement in the number of peer-reviewed articles published for tenure?

0 1-2 3-5 6 or greater

5. Do you have specific requirements in the number of peer-reviewed articles published for promotion? These would be the number of articles published in addition to those published for tenure.

1-2 3-5 6 or greater

6. Are specific journals given greater weight for tenure and/or promotion? If so, please list the title(s) below:

CRL And JAL **Authors Survey**

Question 1: Please enter your name:

Question 2. Institution / Library Name:

Question 3: How long have you been employed as a librarian?

Question 4: From which professional school did you receive your Master's in Library / Information Science?

Question 5: Do you work in an academic library where the librarians hold faculty rank and are eligible for tenure?

Question 6: Do you hold tenure?

Question 7: Since 2000, how many articles have you published in peer-reviewed library journals? (Please check)

0 1 2 3 4 or more
